Bimekizumab safety and tolerability in moderate to severe plaque psoriasis: Pooled analysis from up to 4 years of treatment in 5 phase 3/3b clinical trials

Kenneth B. Gordon,¹ Diamant Thaçi,² Melinda Gooderham,³ Yukari Okubo,⁴ Bruce Strober,⁵ Luke Peterson,⁶ Delphine Deherder, José M. López Pinto, 8 Paolo Gisondi⁹

Objective

To evaluate bimekizumab (BKZ) safety data up to 4 years in patients with moderate to severe plaque psoriasis, using the largest pool of phase 3/3b safety data at the time of this study.

To assess whether rates of treatment-emergent adverse events (TEAEs) changed with each year of BKZ treatment.

Introduction

- BKZ is a monoclonal immunoglobulin G1 antibody that selectively inhibits interleukin (IL)-17F in addition to IL-17A.1
- Psoriasis is a chronic condition requiring long-term management, thus evaluating long-term safety of treatments is essential to informing decision-making for clinicians, while managing risk for patients.²
- We report the first 4-year safety data for BKZ in patients with moderate to severe psoriasis.

Methods

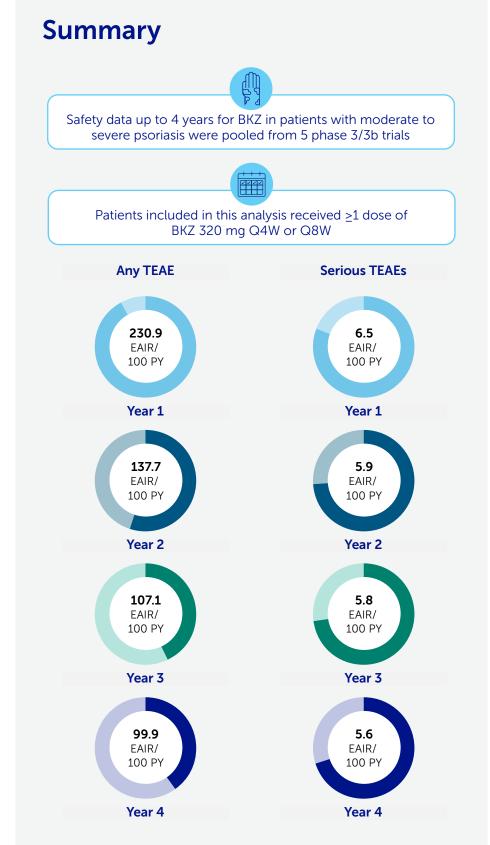

- Data were pooled from the BE SURE, BE VIVID, and BE READY phase 3 trials, their open-label extension (OLE) BE BRIGHT, the BE RADIANT phase 3b trial, and the BE RADIANT OLE.3-7 The BE RADIANT trial ran for 3 years: therefore, the overall total pooled exposure only included BE RADIANT data to Year 3, in addition to BE BRIGHT data to Year 4. Data were pooled for all patients who received ≥1 BKZ dose in the included studies (Figure 1).
- Included patients received BKZ 320 mg every 4 weeks (Q4W) or every 8 weeks (Q8W); all received Q8W from Week 64 (BE RADIANT)/OLE Week 48 (BE BRIGHT) or the next scheduled clinic visit. Patients who switched from adalimumab, ustekinumab, or secukinumab to BKZ in BE SURE, BE VIVID, and BE RADIANT, respectively, were also included
- TEAEs were reported over 4 years using exposure-adjusted incidence rates (EAIRs) per 100 patient-years (PY).
- TEAEs were evaluated separately for Years 1, 2, 3, and 4 (Weeks 0–52, 52-104, 104-156, and 156-208) of BKZ treatment.

Results

- Total BKZ exposure was 6,324.3 PY (N=2,186; Year 1, Year 2, Year 3, Year 4: 2,053.3 PY [n=2,186], 1,904.3 PY [n=2,013], 1,521.1 PY [n=1,803], 819.5 PY [n=1,309]; **Table 1**).
- TEAEs occurred at an EAIR of 170.5/100 PY (Year 1, Year 2, Year 3, Year 4: 230.9/100 PY, 137.7/100 PY, 107.1/100 PY, 99.9/100 PY), serious TEAEs at 5.5/100 PY (6.5/100 PY, 5.9/100 PY, 5.8/100 PY, 5.6/100 PY), and TEAEs leading to discontinuation at 2.9/100 PY (4.6/100 PY, 2.3/100 PY, 2.3/100 PY, 1.1/100 PY). Overall, the EAIR of TEAEs decreased with longer BKZ exposure over 4 years (Figure 2).
- The most common TEAEs were nasopharyngitis at 12.7/100 PY (Year 1, Year 2, Year 3, Year 4: 25.8/100 PY, 13.2/100 PY, 5.4/100 PY, 5.9/100 PY), oral candidiasis at 8.9/100 PY (18.9/100 PY, 10.7/100 PY, 6.8/100 PY, 5.4/100 PY), and upper respiratory tract infection at 5.7/100 PY (10.4/100 PY, 5.7/100 PY, 3.7/100 PY, 3.9/100 PY; **Table 2**).
- Fewer TEAEs over 4 years occurred with BKZ Q8W versus (vs.) Q4W (115.4/100 PY vs. 224.4/100 PY), including for oral candidiasis (6.5/100 PY vs. 16.7/100 PY).

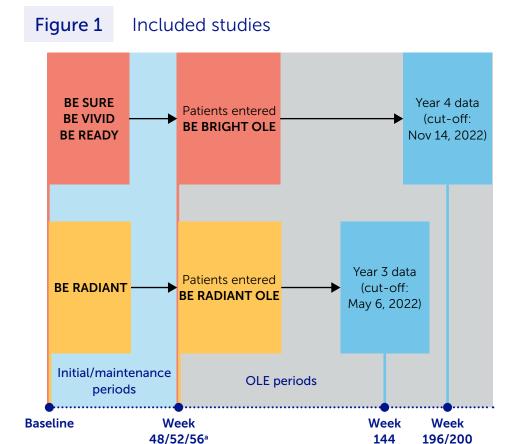

Conclusions

Bimekizumab demonstrated good tolerability and a comparable safety profile over 4 years in patients with moderate to severe plaque psoriasis. EAIRs of TEAEs remained consistent or decreased with longer bimekizumab exposure over 4 years, with no new safety signals observed.

EAIR of TEAEs remained consistent or decreased with

longer BKZ exposure over 4 years

Data and any adjudication are shown as of the data cut-offs (BE RADIANT: May 6, 2022; BE BRIGHT: November 14, 2022) *Patient

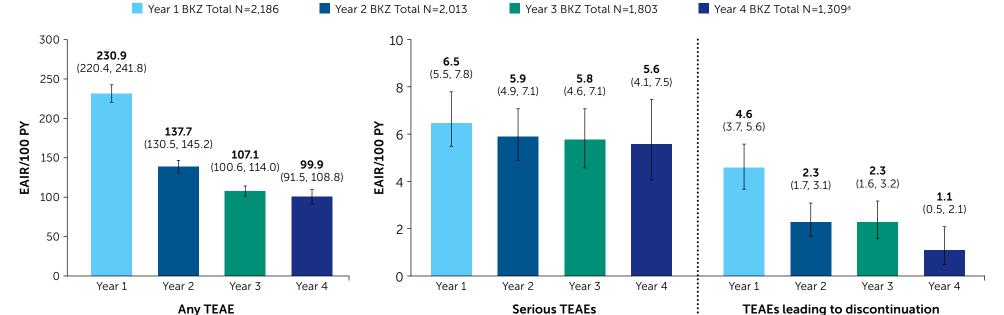

Table 1 Summary of exposure and TEAEs

	BKZ Total						
	Year 1 N=2,186	Year 2 N=2,013	Year 3 N=1,803	Year 4 N=1,309	Overall N=2,186		
Weeks	0-52	52-104ª	104-156ª	156-208	All ^b

	(2.5, 4.2)	(0.6, 1.6)	(0.7, 1.9)	(0.1, 1.1)	(1.4, 2.0)

Data were pooled from the BE SURE, BE VIVID, and BE READY feeder trials, their OLE BE BRIGHT, BE RADIANT, and the BE RADIANT OLE. Data are presented for BKZ Total for the full pooled trial period, and separately for Years 1 (Weeks 0 – 52), 2 (Weeks 52–104), 3 (Weeks 104–156), and 4 (Weeks 156–208). Data were pooled for all patients who received 21 BKZ dose in each of the periods examined (BKZ Total). *Confounding factors linked to the COVID-19 pandemic, including social isolation, mask-wearing, and lockdowns, may have impacted Year 3 and Year 4 data, particularly respiratory infection TEAEs such as nasopharyngitis; The EAIR for oral candidiasis over 4 years was numerically lower in patients receiving BKZ Q8W vs. Q4W (6.5/100 PY vs. 16.7/100 PY); Includes any TEAE adjudicated as definite or probable inflammatory bowel disease; Patients with elevations >5x ULN were a subset of patients with elevations >3x ULN No anaphylactic reactions associated with BKZ were reported.
